

Journal

TauroJG

In this journal, I'm going to keep a record as close as possible to the process of building the keyboard. I'll try to update it every hour. The idea is not only to show you the process, but also to be able to look back in the future and see which parts of the process were inefficient and what I could change or improve.

First hour

During my first hour, I have been sketching and designing what I want my keyboard to look like. For now, I want it to have a personal style inspired by video games and music. It will be a 60% layout, featuring three custom keys and a knob shaped like a vinyl record. I will now begin working on the detailed design of the case, and afterward, I will try creating it from different angles.

Second hour

During my second hour, I focused on drawing the design and painting the keyboard in my own style.

Third-fourth hour

During my third and fourth hours, I managed to create the schematic for the keyboard in KiCad. It was a little difficult because the process was somewhat confusing, especially considering the type of keyboard I want to make, but in the end, I managed to complete the entire schematic.

Fifth hour

Although I wasn't able to work much today, during the hour and a half that I did work (my fifth hour) I organized all the work from yesterday's schematic directly onto the PCB. I arranged all the keys according to the layout I wanted, positioned the stabilizers, and added the OLED screen.

Sixth-ninth hour

From sixth to ninth period, I finished designing the PCB. It took me a long time because I placed the diodes incorrectly on ****all**** the keys, so I had to correct them manually. I also had to redo all the wiring. Now, there are no important errors showing up in the DRC.

tenth hour

Today, I only worked for one hour. During this hour, I added the keycaps to the 3D model and corrected the repository by adding the .zip file.

Eleventh-twelfth hour

Today, I worked for around two hours, during which I completed the 3D modeling step. I still need to export the files and add the connection pins.

thirteenth hour

Well, finally the last step. Now I'm going to finish the 3D model, meaning the pins, and then export it. This has been the first time I've worked on this type of thing, and when it arrives, it will be the first time I work with firmware. I'm excited; I feel like I had never done anything like this before. Thank you, Hack Club :)
